

Abstract:

Car Rental System is a web-based system for a company that rents out cars. This system enables the company to make their services available to the public through the internet and also keep records about their services. The basic functions of an online car rental system are to keep tracks of vehicles, customers and booking. In this we have 2 roles (Manager and customer). The manager manages all the cars available and will be able to delete or add them. The customer can book the car based on the dates in which the customer wants to book the car. When the car is booked another customer cannot book the car on the same dates. The request will be sent to manger and if he accepts then the car is booked. The customer can also cancel the request of booking the car.
